It provides the tools that you need to help remote users with their application problems. It's a lightweight component that comes with two elements, a client and a server, that are easy to configure. Powerful server tool The server component requires little to no configuration and is always active so that it can receive incoming connections from its client counterpart. Easy to configure When running the server executable, you need to specify negotiation and

connection ports by typing them into the Command Prompt window. After doing so, the application starts a server daemon and is ready to accept connections from its client counterpart. User-friendly Users can connect to the server to request assistance through the client. The client can be successfully launched after typing the host address in the Command Prompt and the negotiation port so that it can connect to the server and receive remote assistance. Handy modules It comes with several modules that can prove to be useful if you want to offer

remote assistance to your clients in a quick, convenient manner. You can send them messages, clipboard content or files by using the dedicated functions. Easy to integrate You only need to run the server executable and connect to it for users to request assistance remotely. It can be integrated into both Windows and macOS applications.
