Field of the Invention This invention relates to a rotating machine such as a power generator, and more particularly to a power generator which has a rotor that is rotatable relative to a stator core, and in which the magnetic field generated by the stator core has a configuration that varies in width.

2. Description of the Related Art Generally, a power generator is constructed to generate a magnetic field to rotate a rotor of an electric motor that rotates a generator, or to generate an electric current from a flow of electricity that is applied to the rotor. Here, in the rotating

machine, such as the power generator, the magnetic field is created by a stator core that includes a stator coil, and by a rotor that is coupled to the stator core, and is rotatable relative to the stator core. This power generator, in the past, has been constructed such that the width of the magnetic field generated by the stator core, in the axial direction of the stator core, is constant. For example, in a power generator as shown in FIG. 11, a first pair of axially-opposed stator coils 52a, 52b are disposed on one side of a stator core 50, and a second pair of axially-opposed stator coils 52c, 52d

are disposed on the other side. The axially-opposed stator coils 52a, 52b are connected in series to the stator core 50, and the axially-opposed stator coils 52c, 52d are connected in series to the stator core 50. Thus, magnetic fluxes are generated in the stator core 50 in a predetermined width, and an alternating magnetic field is generated by the stator core 50. In the conventional stator core 50 shown in FIG. 11, however, since the width of the magnetic field in the axial direction is constant, in order to increase the capacity of the stator core 50, a large-size stator core is

needed, and this leads to a large-size power generator. Thus, a method for increasing the capacity of the stator core without using a large-size stator core is disclosed in Japanese Patent Publication No. 7-246328. According to this method, as shown in FIG. 12, a stator 77a5ca646e

Then someone replied and posted a link as proof. I didn't understand how, and I commented "I don't understand how that proves the point, can you explain it further?" I was told that I was trying to prove a point, so I posted it as a question. Then later, the comment

was deleted by the moderator. I don't see why. It's clearly not a question, and it's a good question. Am I missing something? A: The point of that comment is to help the original answerer improve his answer and answer to the question. So the answer is... no, you aren't missing anything. It looks like there are four comments on your question. The last comment was deleted because the mod thought it could be misinterpreted as (I'm not making this up): Please edit this question or ask for help. But even if you'd edited it, it wouldn't have been appropriate to ask a question in a

comment. Atricha
