History AutoCAD 200 AutoCAD 200 was the first version of AutoCAD to support the Microsoft Windows operating system. The Autodesk implementation of a drawing editor is a Java virtual machine (VM), which was based on the AWT toolkit. The application was designed to work with JDK 1.1 and compatible releases such as JDK 1.2, but was not compatible with the first release of Java 2. It supported a relatively small subset of Java's features, and had to be patched to support major additions to the language. The program was available for the Microsoft Windows platform only. AutoCAD 200 required a user-created Java project file to be generated for each drawing. This process could take up to an hour or more. The project file was a text file that contained the Java classes, class dependencies, interface definitions and additional information. Once the project file was created, the AutoCAD 200 Java implementation was converted to an AutoCAD DXF file, but only after they were both imported to the same software. AutoCAD 200's drawing and project files were stored as either ".abn" or ".abp" files, which later evolved into a more advanced object-based file format named ".dwg", used in later AutoCAD versions. A drawing file could contain any number of layers. Layers were represented in an abstract manner, consisting of objects, and this enabled users to interact with drawings using a layer-based interface. The first layer could contain multiple objects, and users could drag-and-drop, rotate, zoom and pan objects to re-arrange and manipulate layers. The Java implementation of AutoCAD was only able to handle projects and drawings that contained no more than eight layers. The editor was limited by this technical constraint. The AutoCAD 200 interface was similar to that of other Java-based software such as WordPerfect, and was dominated by the toolbars and menus that represented the base of the application. AutoCAD 200 supported a wide variety of Windows 3.x-based applications that could import and export a host of AutoCAD file formats, including Microsoft Excel, Access, Paradox, Visio, Filemaker, WordPerfect, Borland Delphi, and other file formats. The C++ object library consisted of basic class implementations that did not include any of the additional functionality provided by the Java implementation. Only the basic Java libraries were imported into the C++ object library. The a1d647c40b
